U =
    0.3624
    0.6094
    2.5053
    1.6900
    1.1971
2.8
>> t = 10:10:60;
>> c = [3.4 \ 2.6 \ 1.6 \ 1.3 \ 1.0 \ 0.5];
>> tf = 0:75;
>> cf = 4.84*exp(-0.034*tf);
>> plot(t,c,'s',tf,cf,':')
>> xlim([0 75])
```

```
2.9
>> t = 10:10:60;
>> c = [3.4 2.6 1.6 1.3 1.0 0.5];
>> tf = 0:70;
>> cf = 4.84*exp(-0.034*tf);
>> semilogy(t,c,'s',tf,cf,'--')
```

The result is a straight line. The reason for this outcome can be understood by taking the common logarithm of the function to give,

$$\log_{10} c = \log_{10} 4.84 - 0.034t \log_{10} e$$

Because  $\log_{10}e = 0.4343$ , this simplifies to the equation for a straight line,

```
\log_{10} c = 0.6848 - 0.0148t
```

The result in (b) is a straight line. The reason for this outcome can be understood by taking the common logarithm of the function to give,

$$\log_{10} k = \log_{10} A - \left(\frac{E}{R} \log_{10} e\right) \frac{1}{T_a}$$

Thus, a plot of  $\log_{10}k$  versus  $1/T_a$  is linear with a slope of  $-(E/R)\log_{10}e = -5.2237 \times 10^3$  and an intercept of  $\log_{10}A = 16.8451$ .
